

Car-to-Motorcycle (MC) crashes

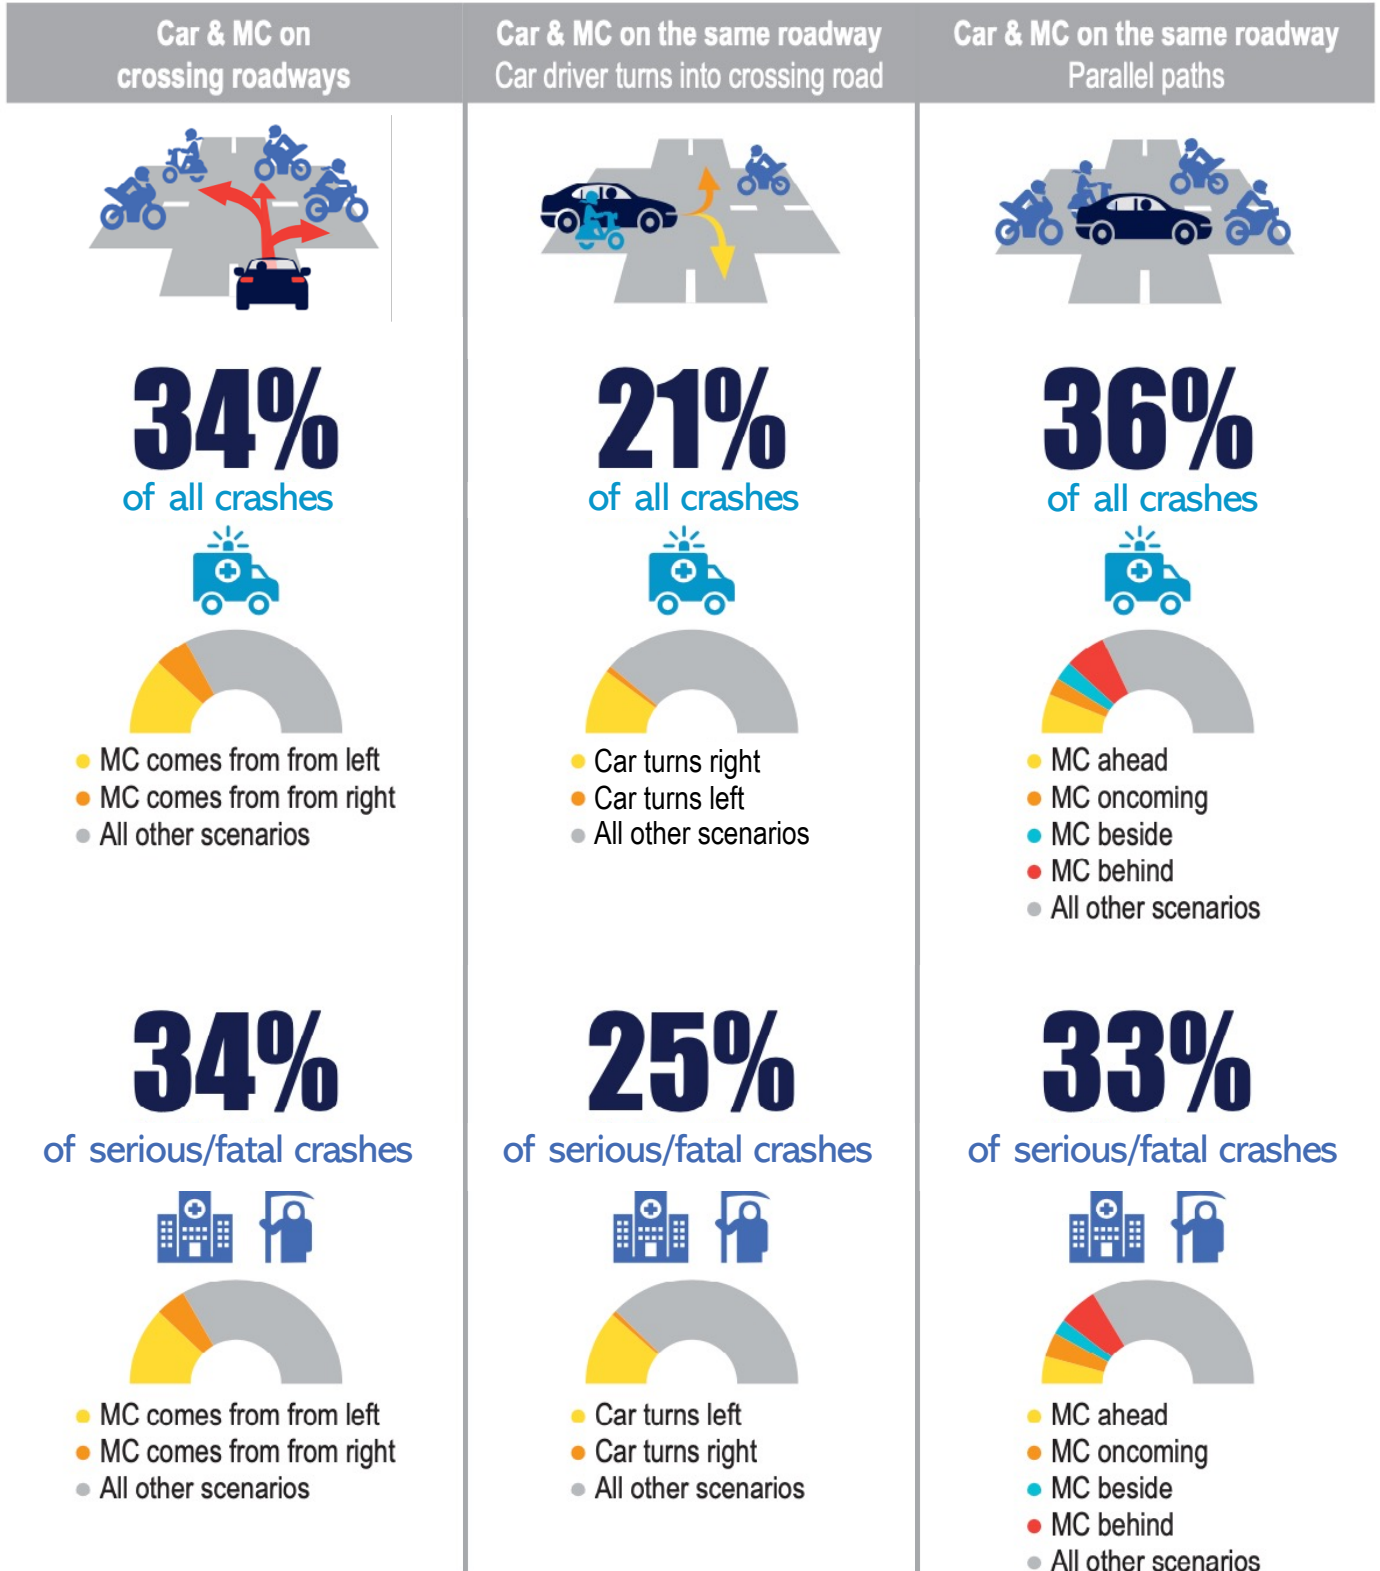

Data source: GIDAS

What are the most common crash scenarios involving **large** motorcycles?

85% of all injury-producing crashes happen in urban areas

30% of serious or fatal oncoming crashes happen in rural areas

Methods note: The in-depth analysis of safety-critical scenarios was performed on data from the German In-Depth Accident Study (GIDAS) database to achieve the required level of detail. The overall statistics from this database closely parallel the European averages. Data cases selected for analysis were from the year 2000 and later. Please see the SAFE-UP website for further details: safe-up.eu

This project has received funding from the European Union's Horizon 2020 research and innovation programme under Grant Agreement No. 861570.
